

## Exercise Problem Sets 4

Mar. 11. 2022

**Problem 1.** Let  $(M, d)$  and  $(N, \rho)$  be metric spaces,  $A \subseteq M$ , and  $f_k : A \rightarrow N$  be a sequence of functions such that for some function  $f : A \rightarrow N$ , we have that for all  $x \in A$ , if  $\{x_k\}_{k=1}^\infty \subseteq A$  and  $x_k \rightarrow x$  as  $k \rightarrow \infty$ , then

$$\lim_{k \rightarrow \infty} f_k(x_k) = f(x).$$

Show that

1.  $\{f_k\}_{k=1}^\infty$  converges pointwise to  $f$ .
2. If  $\{f_{k_j}\}_{j=1}^\infty$  is a subsequence of  $\{f_k\}_{k=1}^\infty$ , and  $\{x_j\}_{j=1}^\infty \subseteq A$  is a convergent sequence satisfying that  $\lim_{j \rightarrow \infty} x_j = x$ , then

$$\lim_{j \rightarrow \infty} f_{k_j}(x_j) = f(x).$$

3. Show that if in addition  $A$  is compact and  $f$  is continuous on  $A$ , then  $\{f_k\}_{k=1}^\infty$  converges uniformly  $f$  on  $A$ .

*Proof.* 1. Let  $x \in A$  be given. Define  $\{x_k\}_{k=1}^\infty$  by  $x_k = x$  for all  $k \in \mathbb{N}$ . Then  $\lim_{k \rightarrow \infty} x_k = x$ ; thus

$$\lim_{k \rightarrow \infty} f_k(x) = \lim_{k \rightarrow \infty} f_k(x_k) = f(x)$$

which shows that  $\{f_k\}_{k=1}^\infty$  converges pointwise to  $f$ .

2. Let  $\{f_{k_j}\}_{j=1}^\infty$  be a subsequence of  $\{f_k\}_{k=1}^\infty$ , and  $\{x_j\}_{j=1}^\infty$  be a convergent sequence with limits  $x$ . Define a new sequence  $\{y_\ell\}_{\ell=1}^\infty$  by

$$y_1, \dots, y_{k_1} = x_1, y_{k_1+1}, \dots, y_{k_2} = x_2, \dots, y_{k_\ell+1}, \dots, y_{k_{\ell+1}} = x_{\ell+1}, \dots;$$

that is, the first  $k_1$  terms of  $\{y_\ell\}_{\ell=1}^\infty$  is  $x_1$ , the next  $(k_2 - k_1)$  terms of  $\{y_\ell\}_{\ell=1}^\infty$  is  $x_2$ , and so on. Then  $\{y_\ell\}_{\ell=1}^\infty$  converges to  $x$ ;

$$\lim_{\ell \rightarrow \infty} f_\ell(y_\ell) = f(x).$$

Since  $\{f_{k_j}(x_j)\}_{j=1}^\infty$  is a subsequence of  $\{f_\ell(y_\ell)\}_{\ell=1}^\infty$ ,  $\lim_{j \rightarrow \infty} f_{k_j}(x_j) = f(x)$ .

3. Suppose the contrary that  $\{f_k\}_{k=1}^\infty$  does not converge uniformly to  $f$  on  $A$ . Then there exists  $\varepsilon > 0$  such that for each  $k > 0$  there exist  $n_k \geq k$  (W.L.O.G. we can assume that  $n_{k+1} > n_k$  for all  $k \in \mathbb{N}$ ) and  $x_k \in A$  such that

$$\rho(f_{n_k}(x_k), f(x_k)) \geq \varepsilon.$$

By the compactness of  $A$ , there exists a convergent subsequence  $\{x_{k_j}\}_{j=1}^\infty$  of  $\{x_k\}_{k=1}^\infty$ . Suppose that  $\lim_{j \rightarrow \infty} x_{k_j} = x$ . Since

$$\rho(f_{n_{k_j}}(x_{k_j}), f(x_{k_j})) \geq \varepsilon \quad \forall j \in \mathbb{N},$$

by the fact that  $\lim_{j \rightarrow \infty} f_{n_{k_j}}(x_{k_j}) = f(x)$  and that  $f$  is continuous at  $x$ , we obtain that

$$\begin{aligned} \rho(f(x), f(x)) &= \lim_{j \rightarrow \infty} \rho(f(x_{k_j}), f(x)) \geq \lim_{j \rightarrow \infty} \left[ \rho(f_{n_{k_j}}(x_{k_j}), f(x_{k_j})) - \rho(f_{n_{k_j}}(x_{k_j}), f(x)) \right] \\ &= \lim_{j \rightarrow \infty} \rho(f_{n_{k_j}}(x_{k_j}), f(x_{k_j})) \geq \frac{\varepsilon}{2}, \end{aligned}$$

a contradiction. □

**Remark.** Using the inequality

$$\rho(f_k(x_k), f(x)) \leq \rho(f(x_k), f(x)) + \sup_{x \in A} \rho(f_k(x), f(x)),$$

we find that if  $\{f_k\}_{k=1}^{\infty}$  converges uniformly to a continuous function  $f$ , then  $\lim_{k \rightarrow \infty} f_k(x_k) = f(x)$  as long as  $\lim_{k \rightarrow \infty} x_k = x$ . Together with the conclusion in 3, we conclude that

Let  $(M, d)$ ,  $(N, \rho)$  be metric spaces,  $K \subseteq M$  be a compact set,  $f_k : K \rightarrow N$  be a function for each  $k \in \mathbb{N}$ , and  $f : K \rightarrow N$  be continuous. The sequence  $\{f_k\}_{k=1}^{\infty}$  converges uniformly to  $f$  if and only if  $\lim_{k \rightarrow \infty} f_k(x_k) = f(x)$  whenever sequence  $\{x_k\}_{k=1}^{\infty} \subseteq K$  converges to  $x$ .

**Problem 2.** Let  $(M, d)$  be a metric space,  $A \subseteq M$ ,  $(N, \rho)$  be a complete metric space, and  $f_k : A \rightarrow N$  be a sequence of functions (not necessary continuous) which converges uniformly on  $A$ . Suppose that  $a \in \text{cl}(A)$  and

$$\lim_{x \rightarrow a} f_k(x) = L_k$$

exists for all  $k \in \mathbb{N}$ . Show that  $\{L_k\}_{k=1}^{\infty}$  converges, and

$$\lim_{x \rightarrow a} \lim_{k \rightarrow \infty} f_k(x) = \lim_{k \rightarrow \infty} \lim_{x \rightarrow a} f_k(x).$$

*Proof.* Let  $\varepsilon > 0$  be given. Since  $\{f_k\}_{k=1}^{\infty}$  converges uniformly, there exists  $N_1 > 0$  such that

$$\rho(f_k(x), f_\ell(x)) < \frac{\varepsilon}{3} \quad \text{whenever } k, \ell \geq N_1 \text{ and } x \in A. \quad (\star)$$

If  $a \in \text{cl}(A)$ , then the inequality above implies that

$$\rho(L_k, L_\ell) = \lim_{x \rightarrow a} \rho(f_k(x), f_\ell(x)) \leq \frac{\varepsilon}{3} < \varepsilon \quad \text{whenever } k, \ell \geq N_1;$$

thus  $\{L_k\}_{k=1}^{\infty}$  is a Cauchy sequence in  $(N, \rho)$ . Therefore,  $\{L_k\}_{k=1}^{\infty}$  converges. Suppose that  $\lim_{k \rightarrow \infty} L_k = L$  and  $\{f_k\}_{k=1}^{\infty}$  converges uniformly to  $f$ . There exists  $N_2 > 0$  such that  $\rho(L_k, L) < \frac{\varepsilon}{3}$  whenever  $k \geq N_2$ . Moreover, passing to the limit as  $\ell \rightarrow \infty$  in  $(\star)$ , we obtain that

$$\rho(f_k(x), f(x)) \leq \frac{\varepsilon}{3} \quad \text{whenever } k \geq N_1 \text{ and } x \in A.$$

Let  $n = \max\{N_1, N_2\}$ . Since  $\lim_{x \rightarrow a} f_n(x) = L_n$ , there exists  $\delta > 0$  such that

$$\rho(f_n(x), L_n) < \frac{\varepsilon}{3} \quad \text{whenever } x \in B(a, \delta) \cap A \setminus \{a\}.$$

Then if  $x \in B(a, \delta) \cap A \setminus \{a\}$ ,

$$\rho(f(x), L) \leq \rho(f(x), f_n(x)) + \rho(f_n(x), L_n) + \rho(L_n, L) < \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} = \varepsilon.$$

Therefore,  $\lim_{x \rightarrow a} f(x) = L$  which shows that  $\lim_{x \rightarrow a} \lim_{k \rightarrow \infty} f_k(x) = \lim_{k \rightarrow \infty} \lim_{x \rightarrow a} f_k(x)$ . □

**Problem 3.** Prove the Dini theorem:

Let  $K$  be a compact set, and  $f_k : K \rightarrow \mathbb{R}$  be continuous for all  $k \in \mathbb{N}$  such that  $\{f_k\}_{k=1}^\infty$  converges pointwise to a continuous function  $f : K \rightarrow \mathbb{R}$ . Suppose that  $f_k \leq f_{k+1}$  for all  $k \in \mathbb{N}$ . Then  $\{f_k\}_{k=1}^\infty$  converges uniformly to  $f$  on  $K$ .

**Hint:** Mimic the proof of showing that  $\{c_k\}_{k=1}^\infty$  converges to 0 in Lemma 6.64 in the lecture note.

*Proof.* Suppose the contrary that there exist  $\varepsilon > 0$  such that

$$\limsup_{k \rightarrow \infty} \sup_{x \in K} |f_k(x) - f(x)| \geq 2\varepsilon.$$

Then there exists  $1 \leq k_1 < k_2 < \dots$  such that

$$\max_{x \in K} |f_{k_j}(x) - f(x)| = \sup_{x \in K} |f_{k_j}(x) - f(x)| > \varepsilon.$$

In other words, for some  $\varepsilon > 0$  and strictly increasing sequence  $\{k_j\}_{j=1}^\infty \subseteq \mathbb{N}$ ,

$$F_j \equiv \{x \in K \mid f(x) - f_{k_j}(x) \geq \varepsilon\} \neq \emptyset \quad \forall j \in \mathbb{N}.$$

Note that since  $f_k \leq f_{k+1}$  for all  $k \in \mathbb{N}$ ,  $F_j \supseteq F_{j+1}$  for all  $j \in \mathbb{N}$ . Moreover, by the continuity of  $f_k$  and  $f$ ,  $F_j$  is a closed subset of  $K$ ; thus  $F_j$  is compact. Therefore, the nested set property for compact sets implies that  $\bigcap_{j=1}^\infty F_j$  is non-empty. In other words, there exists  $x \in K$  such that  $f(x) - f_{k_j}(x) \geq \varepsilon$  for all  $j \in \mathbb{N}$  which contradicts to the fact that  $f_k \rightarrow f$  p.w. on  $K$ . □

**Problem 4.** Let  $(M, d)$  and  $(N, \rho)$  be metric spaces,  $A \subseteq M$ , and  $f_k : A \rightarrow N$  be uniformly continuous functions, and  $\{f_k\}_{k=1}^\infty$  converges uniformly to  $f : A \rightarrow N$  on  $A$ . Show that  $f$  is uniformly continuous on  $A$ .

*Proof.* Let  $\varepsilon > 0$  be given. Since  $\{f_k\}_{k=1}^\infty$  converges uniformly to  $f$ , there exists  $N > 0$  such that

$$\rho(f_k(x), f(x)) < \frac{\varepsilon}{3} \quad \text{whenever } k \geq N \text{ and } x \in A.$$

Since  $f_N$  is uniformly continuous, there exists  $\delta > 0$  such that

$$\rho(f_N(x_1), f_N(x_2)) < \frac{\varepsilon}{3} \quad \text{whenever } x_1, x_2 \in A \text{ and } d(x_1, x_2) < \delta.$$

Therefore, if  $x_1, x_2 \in A$  satisfying  $d(x_1, x_2) < \delta$ , we have

$$\begin{aligned} \rho(f(x_1), f(x_2)) &\leq \rho(f(x_1), f_N(x_1)) + \rho(f_N(x_1), f_N(x_2)) + \rho(f_N(x_2), f(x_2)) \\ &< \frac{\varepsilon}{3} + \frac{\varepsilon}{3} + \frac{\varepsilon}{3} = \varepsilon; \end{aligned}$$

thus  $f$  is uniformly continuous on  $A$ . □

**Problem 5.** Complete the following.

1. Suppose that  $f_k, f, g : [0, \infty) \rightarrow \mathbb{R}$  are functions such that

(a)  $\forall R > 0$ ,  $f_k$  and  $g$  are Riemann integrable on  $[0, R]$ ;

(b)  $|f_k(x)| \leq g(x)$  for all  $k \in \mathbb{N}$  and  $x \in [0, \infty)$ ;

(c)  $\forall R > 0$ ,  $\{f_k\}_{k=1}^\infty$  converges to  $f$  uniformly on  $[0, R]$ ;

(d)  $\int_0^\infty g(x) dx \equiv \lim_{R \rightarrow \infty} \int_0^R g(x) dx < \infty$ .

Show that  $\lim_{k \rightarrow \infty} \int_0^\infty f_k(x) dx = \int_0^\infty f(x) dx$ ; that is,

$$\lim_{k \rightarrow \infty} \lim_{R \rightarrow \infty} \int_0^R f_k(x) dx = \lim_{R \rightarrow \infty} \lim_{k \rightarrow \infty} \int_0^R f_k(x) dx.$$

2. Let  $f_k(x)$  be given by  $f_k(x) = \begin{cases} 1 & \text{if } k-1 \leq x < k, \\ 0 & \text{otherwise.} \end{cases}$  Find the (pointwise) limit  $f$  of the sequence  $\{f_k\}_{k=1}^\infty$ , and check whether  $\lim_{k \rightarrow \infty} \int_0^\infty f_k(x) dx = \int_0^\infty f(x) dx$  or not. Briefly explain why one can or cannot apply 1.

3. Let  $f_k : [0, \infty) \rightarrow \mathbb{R}$  be given by  $f_k(x) = \frac{x}{1+kx^4}$ . Find  $\lim_{k \rightarrow \infty} \int_0^\infty f_k(x) dx$ .

*Proof.* 1. First we note that since  $|f_k(x)| \leq g(x)$  for all  $x \in \mathbb{R}$ , passing to the limit as  $k \rightarrow \infty$  shows that  $|f(x)| \leq g(x)$  for all  $x \in \mathbb{R}$ .

Let  $\varepsilon > 0$  be given. Since  $\lim_{R \rightarrow \infty} \int_0^R g(x) dx = \int_0^\infty g(x) dx$  exists, there exists  $M > 0$  such that

$$\left| \int_R^\infty g(x) dx \right| = \left| \int_0^R g(x) dx - \int_0^\infty g(x) dx \right| < \frac{\varepsilon}{3} \quad \forall R \geq M.$$

Since  $\{f_k\}_{k=1}^\infty$  converges uniformly on  $[0, M]$ ,  $\lim_{k \rightarrow \infty} \int_0^M f_k(x) dx = \int_0^M f(x) dx$ ; thus there exists  $N \geq 0$  such that

$$\left| \int_0^M f_k(x) dx - \int_0^M f(x) dx \right| < \frac{\varepsilon}{3} \quad \text{whenever } k \geq N.$$

Therefore, if  $k \geq N$ , we have

$$\begin{aligned} & \left| \int_0^\infty f_k(x) dx - \int_0^\infty f(x) dx \right| \\ & \leq \left| \int_0^M f_k(x) dx - \int_0^M f(x) dx \right| + \int_M^\infty |f(x)| dx + \int_M^\infty |f_k(x)| dx \\ & < \frac{\varepsilon}{3} + 2 \int_M^\infty g(x) dx < \frac{\varepsilon}{3} + \frac{2\varepsilon}{3} = \varepsilon. \end{aligned}$$

thus  $\lim_{k \rightarrow \infty} \int_0^{\infty} f_k(x) dx = \int_0^{\infty} f(x) dx$ . This implies that

$$\begin{aligned} \lim_{k \rightarrow \infty} \lim_{R \rightarrow \infty} \int_0^R f_k(x) dx &= \lim_{k \rightarrow \infty} \int_0^{\infty} f_k(x) dx = \int_0^{\infty} f(x) dx = \lim_{R \rightarrow \infty} \int_0^R f(x) dx \\ &= \lim_{R \rightarrow \infty} \lim_{k \rightarrow \infty} \int_0^R f_k(x) dx. \end{aligned}$$

2. If  $x \in [0, \infty)$ , we have  $x \leq N$  for some  $N \in \mathbb{N}$  (by the Archimedean property); thus for  $k \geq N$  we have  $f_k(x) = 0$ . In other words,  $\{f_k\}_{k=1}^{\infty}$  converges pointwise to the zero function. Let  $f$  be the zero function. Then

$$\int_0^{\infty} f_k(x) dx = \int_{k-1}^k 1 dx = 1$$

so that  $\lim_{k \rightarrow \infty} \int_0^{\infty} f_k(x) dx = 1 \neq 0 = \int_0^{\infty} f(x) dx$ . This is because we cannot find an integrable  $g$  satisfying that  $|f_k(x)| \leq g(x)$  for all  $x \in [0, \infty)$ . In fact, if  $|f_k(x)| \leq g(x)$  for all  $x \in [0, \infty)$ , then  $g(x) \geq 1$  for all  $x \in [0, \infty)$ .

3. Let  $g(x) = \frac{x}{1+x^4}$ . Then  $|f_k(x)| \leq g(x)$  for all  $x \in [0, \infty)$  and  $k \in \mathbb{N}$ . Since  $g(x) \leq x$  for  $x \in [0, 1]$  and  $g(x) \leq \frac{1}{x^3}$  for  $x \geq 1$ , we find that

$$\int_0^{\infty} g(x) dx \leq \int_0^1 x dx + \int_1^{\infty} \frac{1}{x^3} dx = \frac{1}{2} + \frac{1}{2} = 1 < \infty.$$

Moreover,

$$f'_k(x) = \frac{1 + kx^4 - 4kx^4}{(1 + kx^4)^2} = \frac{1 - 3kx^4}{(1 + kx^4)^2}$$

which implies that for each  $R > 0$ ,

$$\sup_{x \in [0, R]} |f_k(x)| \leq |f_k(0)| + |f_k(R)| + \left| \frac{(3k)^{-\frac{1}{4}}}{1 + k \cdot \frac{1}{3k}} \right| = \frac{R}{1 + kR^4} + \frac{3}{4} \left( \frac{1}{3k} \right)^{\frac{1}{4}}.$$

Therefore, the Sandwich Lemma implies that  $\lim_{k \rightarrow \infty} \sup_{x \in [0, R]} |f_k(x)| = 0$  which shows that  $\{f_k\}_{k=1}^{\infty}$  converges uniformly to the zero function on  $[0, R]$  for every  $R > 0$ . By 1,

$$\lim_{k \rightarrow \infty} \int_0^{\infty} f_k(x) dx = 0. \quad \square$$
