§1.4 Basic Proof Methods I

§1.5 Basic Proof Methods II

§1.6 Proofs Involving Quantifiers

§1.7 Strategies for Constructing Proofs

§1.8 Proofs from Number Theory

# §1.1 Propositions and Connectives

## Definition

A **proposition** is a sentence that has exactly one truth value. It is either true, which we denote by T, or false, which we denote by F.

## Example

$7^2 > 60$  (F),  $\pi > 3$  (T), Earth is the closest planet to the sun (F).

## Example

The statement “the north Pacific right whale (露脊鯨) will be extinct species before the year 2525” has one truth value but it takes time to determine the truth value.

## Example

That “Euclid was left-handed” is a statement that has one truth value but may never be known.

## §1.1 Propositions and Connectives

## Definition

A **negation** of a proposition  $P$ , denoted by  $\sim P$ , is the proposition “not  $P$ ”. The proposition  $\sim P$  is 

true	exactly when $P$ is	false
false		true

.

## Definition

Given propositions  $P$  and  $Q$ , the **conjunction** of  $P$  and  $Q$ , denoted by  $P \wedge Q$ , is the proposition “ $P$  **and**  $Q$ ”.  $P \wedge Q$  is true exactly when **both  $P$  and  $Q$  are true**.

The **disjunction** of  $P$  and  $Q$ , denoted by  $P \vee Q$ , is the proposition “ $P$  **or**  $Q$ ”.  $P \vee Q$  is true exactly when **at least one of  $P$  or  $Q$  is true**.

## §1.1 Propositions and Connectives

## Example

Now we analyze the sentence “either 7 is prime and 9 is even, or else 11 is not less than 3”. Let  $P$  denote the sentence “7 is a prime”,  $Q$  denote the sentence “9 is even”, and  $R$  denote the sentence “11 is less than 3”. Then the original sentence can be symbolized by  $(P \wedge Q) \vee (\sim R)$ , and the table of truth value for this sentence is

$P$	$Q$	$R$	$P \wedge Q$	$\sim R$	$(P \wedge Q) \vee (\sim R)$
T	T	T	T	F	T
T	T	F	T	T	T
T	F	T	F	F	F
F	T	T	F	F	F
T	F	F	F	T	T
F	T	F	F	T	T
F	F	T	F	F	F
F	F	F	F	T	T

Since  $P$  is true and  $Q, R$  are false, the sentence  $(P \wedge Q) \vee (\sim R)$  is true.

# §1.1 Propositions and Connectives

## Definition

A **tautology** is a propositional form that is true for every assignment of truth values to its component.

A **contradiction** is a propositional form that is false for every assignment of truth values to its component.

## Example

The logic symbol  $(P \vee Q) \vee (\sim P \wedge \sim Q)$  is a tautology.

## Example

The logic symbol  $\sim (P \vee \sim P) \vee (Q \wedge \sim Q)$  is a contradiction.

## Definition

Two propositional forms are said to be **equivalent** if they have the same truth value.

## §1.1 Propositions and Connectives

## Theorem

For propositions  $P$ ,  $Q$ ,  $R$ , we have the following:

$$(a) P \Leftrightarrow \sim(\sim P). \quad (\text{Double Negation Law})$$

$$\left. \begin{array}{l} (b) P \vee Q \Leftrightarrow Q \vee P \\ (c) P \wedge Q \Leftrightarrow Q \wedge P \end{array} \right\} \quad (\text{Commutative Laws})$$

$$\left. \begin{array}{l} (d) P \vee (Q \vee R) \Leftrightarrow (P \vee Q) \vee R \\ (e) P \wedge (Q \wedge R) \Leftrightarrow (P \wedge Q) \wedge R \end{array} \right\} \quad (\text{Associative Laws})$$

$$\left. \begin{array}{l} (f) P \wedge (Q \vee R) \Leftrightarrow (P \wedge Q) \vee (P \wedge R) \\ (g) P \vee (Q \wedge R) \Leftrightarrow (P \vee Q) \wedge (P \vee R) \end{array} \right\} \quad (\text{Distributive Laws})$$

$$\left. \begin{array}{l} (h) \sim(P \wedge Q) \Leftrightarrow (\sim P) \vee (\sim Q) \\ (i) \sim(P \vee Q) \Leftrightarrow (\sim P) \wedge (\sim Q) \end{array} \right\} \quad (\text{De Morgan's Laws})$$

## §1.1 Propositions and Connectives

Proof.

We prove (g) for example, and the other cases can be shown in a similar fashion. Using the truth table,

P	Q	R	$Q \wedge R$	$P \vee (Q \wedge R)$	$P \vee Q$	$P \vee R$	$(P \vee Q) \wedge (P \vee R)$
T	T	T	T	T	T	T	T
T	T	F	F	T	T	T	T
T	F	T	F	T	T	T	T
F	T	T	T	T	T	T	T
T	F	F	F	T	T	T	T
F	T	F	F	F	T	F	F
F	F	T	F	F	F	T	F
F	F	F	F	F	F	F	F

we find that " $P \vee (Q \wedge R)$ " is equivalent to " $(P \vee Q) \wedge (P \vee R)$ ".  $\square$

## §1.1 Propositions and Connectives

## Definition

A **denial** of a proposition is any proposition equivalent to  $\sim P$ .

• **Rules for  $\sim$ ,  $\wedge$  and  $\vee$ :**

- ①  $\sim$  is always applied to the smallest proposition following it.
- ②  $\wedge$  connects the smallest propositions surrounding it.
- ③  $\vee$  connects the smallest propositions surrounding it.

## Example

Under the convention above, we have

- ①  $\sim P \vee \sim Q \Leftrightarrow (\sim P) \vee (\sim Q)$ .
- ②  $P \vee Q \vee R \Leftrightarrow (P \vee Q) \vee R \Leftrightarrow P \vee (Q \vee R)$ .
- ③  $P \wedge \sim Q \vee \sim R \Leftrightarrow [P \wedge (\sim Q)] \vee (\sim R)$ .
- ④  $R \wedge P \wedge S \wedge Q \Leftrightarrow [(R \wedge P) \wedge S] \wedge Q$ .

## §1.2 Conditionals and Biconditionals

### Definition

For propositions  $P$  and  $Q$ , the **conditional sentence**  $P \Rightarrow Q$  is the proposition “if  $P$ , then  $Q$ ”. Proposition  $P$  is called the **antecedent** and  $Q$  is the **consequence**. The sentence  $P \Rightarrow Q$  is true if and only if  $P$  is false or  $Q$  is true.

### Remark:

In a conditional sentence,  **$P$  and  $Q$  might not have connections**. The truth value of the sentence “ $P \Rightarrow Q$ ” only depends on the truth value of  $P$  and  $Q$ .

## §1.2 Conditionals and Biconditionals

### Example

We would like to determine the truth value of the sentence “if  $x > 8$ , then  $x > 5$ ”. Let  $P$  denote the sentence “ $x > 8$ ” and  $Q$  the sentence “ $x > 5$ ”.

- 1 If  $P$ ,  $Q$  are both true statements, then  $x > 8$  which is (exactly the same as  $P$  thus) true.
- 2 If  $P$  is false while  $Q$  is true, then  $5 < x \leq 8$  which is (exactly the same as  $\sim P \wedge Q$  thus) true.
- 3 If  $P$ ,  $Q$  are both false statements, then  $x \leq 5$  which is (exactly the same as  $\sim Q$  thus) true.
- 4 It is not possible to have  $P$  true but  $Q$  false.

## §1.2 Conditionals and Biconditionals

- **How to read  $P \Rightarrow Q$  in English?**

1. If P, then Q.
2. P is sufficient for Q.
3. P only if Q.
4. Q whenever P.
5. Q is necessary for P.
6. Q, if/when P.

### Definition

Let P and Q be propositions.

- ① The **converse** of  $P \Rightarrow Q$  is  $Q \Rightarrow P$ .
- ② The **contrapositive** of  $P \Rightarrow Q$  is  $\sim Q \Rightarrow \sim P$ .

## §1.2 Conditionals and Biconditionals

### Example

We would like to determine the truth value, as well as the converse and the contrapositive, of the sentence “if  $\pi$  is an integer, then 14 is even”.

- 1 Since that  $\pi$  is an integer is false, the implication “if  $\pi$  is an integer, then 14 is even” is true.
- 2 The converse of the sentence is “if 14 is even, then  $\pi$  is an integer” which is a false statement.
- 3 The contrapositive of the sentence is “if 14 is not even, then  $\pi$  is not an integer” which is a true statement since the antecedent “14 is not even” is false.

By this example, we know that a sentence and its converse cannot be equivalent.

## §1.2 Conditionals and Biconditionals

## Theorem

For propositions  $P$  and  $Q$ , the sentence  $P \Rightarrow Q$  is equivalent to its contrapositive  $\sim Q \Rightarrow \sim P$ .

## Proof.

Using the truth table

$P$	$Q$	$P \Rightarrow Q$	$\sim Q$	$\sim P$	$\sim Q \Rightarrow \sim P$
T	T	T	F	F	T
T	F	F	T	F	F
F	T	T	F	T	T
F	F	T	T	T	T

we conclude that the truth value of  $P \Rightarrow Q$  and  $\sim Q \Rightarrow \sim P$  are the same; thus they are equivalent sentences.  $\square$

## §1.2 Conditionals and Biconditionals

## Definition

For propositions  $P$  and  $Q$ , the **bi-conditional sentence**  $P \Leftrightarrow Q$  is the proposition “ $P$  if and only if  $Q$ ”. The sentence  $P \Leftrightarrow Q$  is true exactly when  $P$  and  $Q$  have the same truth values. In other words,  $P \Leftrightarrow Q$  is true if and only if  $P$  is equivalent to  $Q$ .

**Remark:** The notation  $\Leftrightarrow$  is a combination of  $\Rightarrow$  and its converse  $\Leftarrow$ , so the notation seems to suggest that  $(P \Leftrightarrow Q)$  is equivalent to  $(P \Rightarrow Q) \wedge (Q \Rightarrow P)$ . This is in fact true since

$P$	$Q$	$P \Leftrightarrow Q$	$P \Rightarrow Q$	$Q \Rightarrow P$	$(P \Rightarrow Q) \wedge (Q \Rightarrow P)$
T	T	T	T	T	T
T	F	F	F	T	F
F	T	F	T	F	F
F	F	T	T	T	T

## §1.2 Conditionals and Biconditionals

### Example

- 1 The proposition “ $2^3 = 8$  if and only if 49 is a perfect square” is true because both components are true.
- 2 The proposition “ $\pi = \frac{22}{7}$  if and only if  $\sqrt{2}$  is a rational number” is also true (since both components are false).
- 3 The proposition “ $6 + 1 = 7$  if and only if Argentina is north of the equator” is false because the truth values of the components differ.

## §1.2 Conditionals and Biconditionals

### Remark:

Definitions may be stated with the “if and only if” wording, but it is also common practice to state a formal definition using the word “if”. For example, we could say that “a function  $f$  is continuous at a number  $c$  if  $\dots$ ” leaving the “only if” part understood.

### Example

A teacher says “If you score 74% or higher on the next test, you will pass the exam”. Even though this is a conditional sentence, everyone will interpret the meaning as a biconditional (since the teacher tries to “define” how you can pass the exam).

## §1.2 Conditionals and Biconditionals

## Theorem

For propositions  $P$ ,  $Q$  and  $R$ , we have the following:

$$(a) \quad (P \Rightarrow Q) \Leftrightarrow (\sim P \vee Q).$$

$$(b) \quad (P \Leftrightarrow Q) \Leftrightarrow (P \Rightarrow Q) \wedge (Q \Rightarrow P).$$

$$(c) \quad \sim(P \Rightarrow Q) \Leftrightarrow (P \wedge \sim Q).$$

$$(d) \quad \sim(P \wedge Q) \Leftrightarrow (P \Rightarrow \sim Q).$$

$$(e) \quad \sim(P \wedge Q) \Leftrightarrow (Q \Rightarrow \sim P).$$

$$(f) \quad P \Rightarrow (Q \Rightarrow R) \Leftrightarrow (P \wedge Q) \Rightarrow R.$$

$$(g) \quad P \Rightarrow (Q \wedge R) \Leftrightarrow (P \Rightarrow Q) \wedge (P \Rightarrow R).$$

$$(h) \quad (P \vee Q) \Rightarrow R \Leftrightarrow (P \Rightarrow R) \wedge (Q \Rightarrow R).$$

## §1.2 Conditionals and Biconditionals

- **How to read  $P \Leftrightarrow Q$  in English?**

1. P if and only if Q.
2. P if, but only if, Q.
3. P implies Q, and conversely.
4. P is equivalent to Q.
5. P is necessary and sufficient for Q.

- **Rules for  $\sim$ ,  $\wedge$ ,  $\vee$ ,  $\Rightarrow$  and  $\Leftrightarrow$ :** These connectives are always applied in the order listed.

### Example

- ①  $P \Rightarrow \sim Q \vee R \Leftrightarrow S$  is an abbr. for  $(P \Rightarrow [(\sim Q) \vee R]) \Leftrightarrow S$ .
- ②  $P \vee \sim Q \Leftrightarrow R \Rightarrow S$  is an abbr. for  $[P \vee (\sim Q)] \Leftrightarrow (R \Rightarrow S)$ .
- ③  $P \Rightarrow Q \Rightarrow R$  is an abbr. for  $(P \Rightarrow Q) \Rightarrow R$ .

## §1.3 Quantified Statements

### Definition

An **open sentence** is a sentence that contains variables. When  $P$  is an open sentence with a variable  $x$  (or variables  $x_1, \dots, x_n$ ), the sentence is symbolized by  $P(x)$  (or  $P(x_1, \dots, x_n)$ ).

The **truth set** of an open sentence is the collection of variables (from a certain universe) that may be substituted to make the open sentence a true proposition. (使得  $P(x)$  為真的所有  $x$  形成 the truth set of  $P(x)$ )

### Remark:

In general, **an open sentence is not a proposition**. It can be true or false depending on the value of variables.

## §1.3 Quantified Statements

### Example

Let  $P(x)$  be the open sentence “ $x$  is a prime number between 5060 and 5090”. In this open sentence, the universe is usually chosen to be  $\mathbb{N}$ , the natural number system, and the truth set of  $P(x)$  is  $\{5077, 5081, 5087\}$ .

### Remark:

The truth set of an open sentence  $P(x)$  depends on the universe where  $x$  belongs to. For example, suppose that  $P(x)$  is the open sentence “ $x^2 + 1 = 0$ ”. If the universe is  $\mathbb{R}$ , then  $P(x)$  is false for all  $x$  (in the universe). On the other hand, if the universe is  $\mathbb{C}$ , the complex plane, then  $P(x)$  is true when  $x = \pm i$  (which also implies that the truth set of  $P(x)$  is  $\{i, -i\}$ ).

## §1.3 Quantified Statements

### Definition

With a universe  $X$  specified, two open sentences  $P(x)$  and  $Q(x)$  are equivalent if they have the same truth set of all  $x \in X$ .

### Example

The two sentences “ $3x + 2 = 20$ ” and “ $2x - 7 = 5$ ” are equivalent open sentences in any of the number system, such as  $\mathbb{N}$ ,  $\mathbb{Z}$ ,  $\mathbb{Q}$ ,  $\mathbb{R}$  and  $\mathbb{C}$ .

### Example

The two sentences “ $x^2 - 1 > 0$ ” and “ $(x < -1) \vee (x > 1)$ ” are equivalent open sentences in  $\mathbb{R}$ .

## §1.3 Quantified Statements

Given an open sentence  $P(x)$ , the first question that we should ask ourself is “whether the truth set of  $P(x)$  is empty or not”.

### Definition

The symbol  $\exists$  is called the *existential quantifier*. For an open sentence  $P(x)$ , the sentence  $(\exists x)P(x)$  is read “there exists  $x$  such that  $P(x)$ ” or “for some  $x$ ,  $P(x)$ ”. The sentence  $(\exists x)P(x)$  is true if the truth set of  $P(x)$  is non-empty.

### Remark:

An open sentence  $P(x)$  does **not** have a truth value, but the quantified sentence  $(\exists x)P(x)$  does.

## §1.3 Quantified Statements

## Example

The quantified sentence  $(\exists x)(x^7 - 12x^3 + 16x - 3 = 0)$  is true in the universe of real numbers.

## Example (Fermat number)

The quantified sentence  $(\exists n)(2^{2^n} + 1 \text{ is a prime number})$  is true in the universe of natural numbers.

## Example (Fermat's last theorem)

The quantified sentence

$$(\exists x, y, z, n)(x^n + y^n = z^n \wedge n \geq 3)$$

is true in the universe of integers, but is false in the universe of natural numbers.

## §1.3 Quantified Statements

### Definition

The symbol  $\forall$  is called the **universal quantifier**. For an open sentence  $P(x)$ , the sentence  $(\forall x)P(x)$  is read “for all  $x$ ,  $P(x)$ ”, “for every  $x$ ,  $P(x)$ ” or “for every given  $x$  (in the universe),  $P(x)$ ”. The sentence  $(\forall x)P(x)$  is true if the truth set of  $P(x)$  is the entire universe.

### Example

The quantified sentence  $(\forall n)(2^{2^n} + 1 \text{ is a prime number})$  is false in the universe of natural numbers since

$$2^{2^6} + 1 = 641 \times 6700417.$$

## §1.3 Quantified Statements

In general, statements of the form “every element of the set  $A$  has the property  $P$ ” and “some element of the set  $A$  has property  $P$ ” may be symbolized as  $(\forall x \in A)P(x)$  and  $(\exists x \in A)P(x)$ , respectively. Moreover,

- ① “All  $P(x)$  are  $Q(x)$ ” (所有滿足  $P$  的  $x$  都滿足  $Q$  or 只要滿足  $P$  的  $x$  就滿足  $Q$ ) should be symbolized as

$$“(\forall x)(P(x) \Rightarrow Q(x))”.$$

**(See the next slide for the explanation!)**

- ② “Some  $P(x)$  are  $Q(x)$ ” (有些滿足  $P$  的  $x$  也滿足  $Q$  or 有些  $x$  同時滿足  $P$  和  $Q$ ) should be symbolized as

$$“(\exists x)(P(x) \wedge Q(x))”.$$
